

Counter function output

```
function Counter () {  
  var count = 0;  
  console.log("internal--console-count:",count)  
  this.incrementCounter = function () {  
    count++;  
    console.log(count);  
  }  
  
  this.decrementCounter = function () {  
    count--;  
    console.log(count);  
  }  
}
```

what will be the output:

```
console.log(Counter());
```

Let's go step by step 🙋

Code:

```
js  
  
function Counter () {  
  var count = 0;  
  console.log("internal--console-count:", count);  
  
  this.incrementCounter = function () {  
    count++;  
    console.log(count);  
  }  
  
  this.decrementCounter = function () {  
    count--;  
    console.log(count);  
  }  
}  
  
console.log(Counter());
```

🔍 Step-by-step execution:

1. The function `Counter()` is **called directly**, not with `new`.

👉 So it is a **regular function call, not a constructor call**.

Inside the function:

- A variable `count` is declared and initialized to `0`.
- Immediately after that,

```
js
console.log("internal--console-count:", count);
```

gets executed.

✓ Output (first log):

```
pgsql
internal--console-count: 0
```

Then:

`this.incrementCounter` and `this.decrementCounter` are assigned as functions.

But — since you **didn't use** `new`,

in **non-strict mode**, `this` refers to the **global object** (**window in browsers**).

In **strict mode**, `this` would be **undefined** and it would throw an error.

Finally:

`Counter()` doesn't have a **return** statement,
so it implicitly returns **undefined**.

So this line:

```
js
console.log(Counter());
```

logs:

```
javascript
undefined
```

✓ Final Output (non-strict mode):

```
javascript
internal--console-count: 0
undefined
```

⚠ In strict mode ('use strict' on top):

You'd get:

```
javascript

internal--console-count: 0
TypeError: Cannot set properties of undefined (setting 'incrementCounter')
```

because **this** is **undefined** when not called with **new**.

💡 Summary:

Case	Behavior
Non-strict mode	Prints " internal--console-count: 0 " and then " undefined ".
Strict mode	Throws TypeError because this is undefined .

Would you like me to show how the output changes if you call it as **new Counter()** instead?
